

Sovereign Commercial Services, Inc.

Electrostatic Wide Area Disinfection Program

Program Outline:

The program is designed to provide an additional measure to routine cleaning to address the on-going concerns of the spread of the Coronavirus (COVID19) in work places and heavily used environments. It is recommended to provide additional disinfection to offices, restrooms, break areas, and common areas such as reception areas, hallways, elevators, and stairwells.

What is Electrostatic Technology?

As the chemical exits the electrostatic sprayer, it is atomized and given a positive charge. The positively charged spray droplets are attracted to — and travel toward — negatively charged objects, creating a 360-degree wraparound effect on the targeted surface.

Program Components:

1. This service must be provided in a vacant environment and is best performed after normal business hours.
2. An EPA approved disinfectant will be applied by the Sovereign technician through the Electrostatic Equipment at a dilution rate of 2 oz. per gallon. This product is approved for disinfection against a wide variety of pathogens and viruses.
3. The application process includes all surfaces in the identified space by moving through the space counter clockwise and applying the charged disinfectant to all surfaces from a distance of 2-3 feet.
4. The disinfectant will then automatically attach to the targeted surface and air dry allowing for proper dwell time. The space may be occupied soon after spraying, as early as thirty to sixty minutes. This is not a replacement for routine cleaning, it is only a disinfectant to be applied to clean surfaces that are often touched.
5. The application process is not for direct application to electronic devices such as computers, printers, copiers and phones or food preparation surfaces.

This program is available to clients and scheduling is required. Please contact your Sovereign Client Services Manager or Relationship Manager for a quotation or email us at info@sovereigncs.com
